I'll cover all 8 T1 article topics, with 3 image or video choices per topic (24 total), regardless of the original publisher.

These are independently retrieved candidate sources, not verified Google Images ranking positions. I'll prioritize material available by March 6, 2026, T1's evidence cutoff, and identify images that are merely illustrative rather than direct visual proof.

T1 — Image and video candidates

1. Oil prices heading for largest weekly gains since 2020

Choice 1 — Reuters oil-market coveraget

Reuters, March 6

Reports large weekly oil-price increases. Associated news imagery may be contextual rather than a price chart.

reuters.com

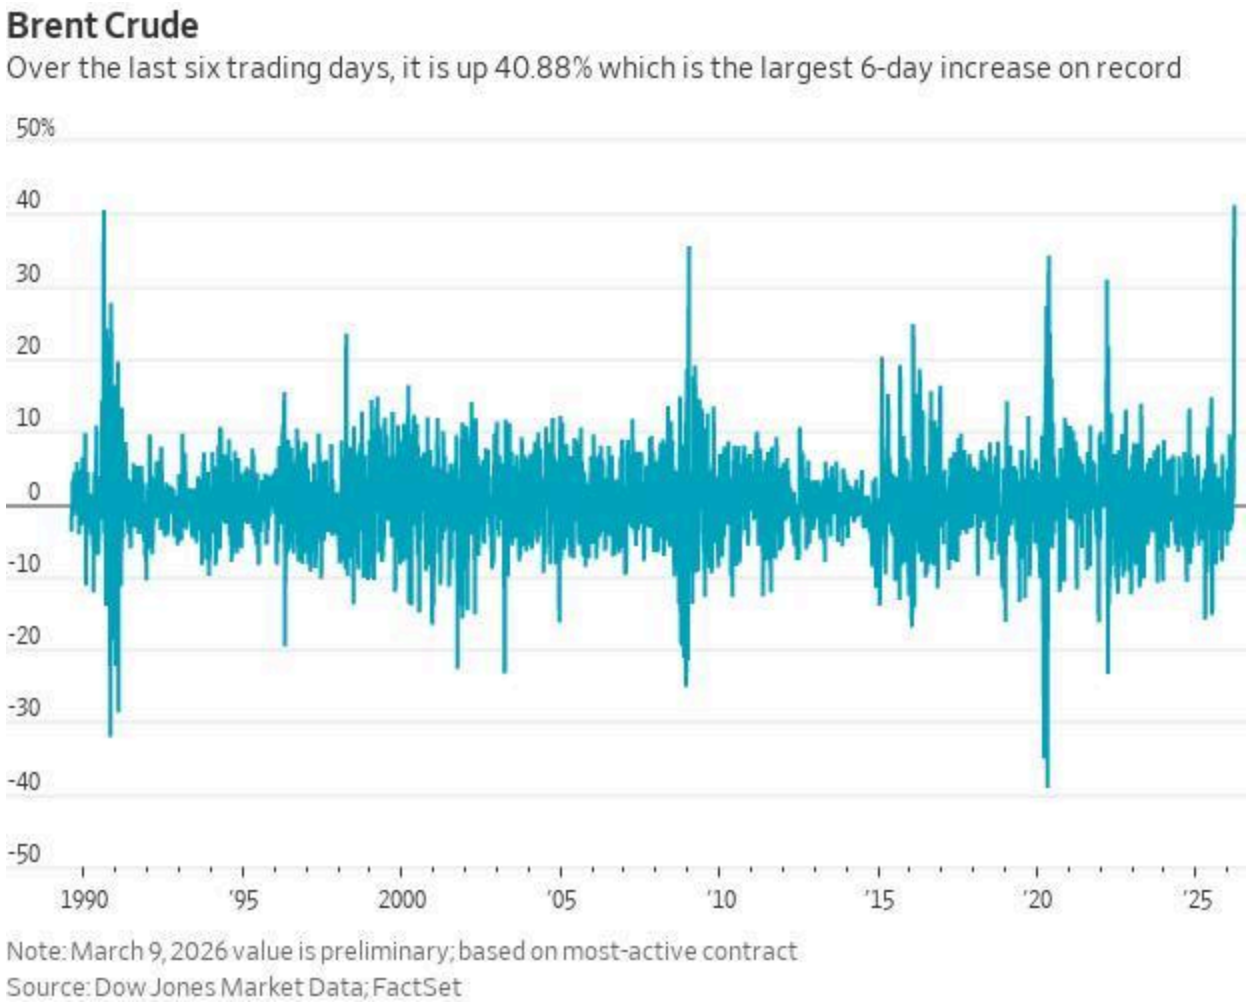

Choice 2 — Fuel prices at a London station

Korea Times, March 6

Actual dated fuel-station photograph. Illustrates energy prices, but doesn't prove the weekly crude-oil percentage change.

The Korea Times

Choice 3 — Oil-market visual

Investing.com, March 6

Reuters-credited imagery accompanying the price surge reporting.

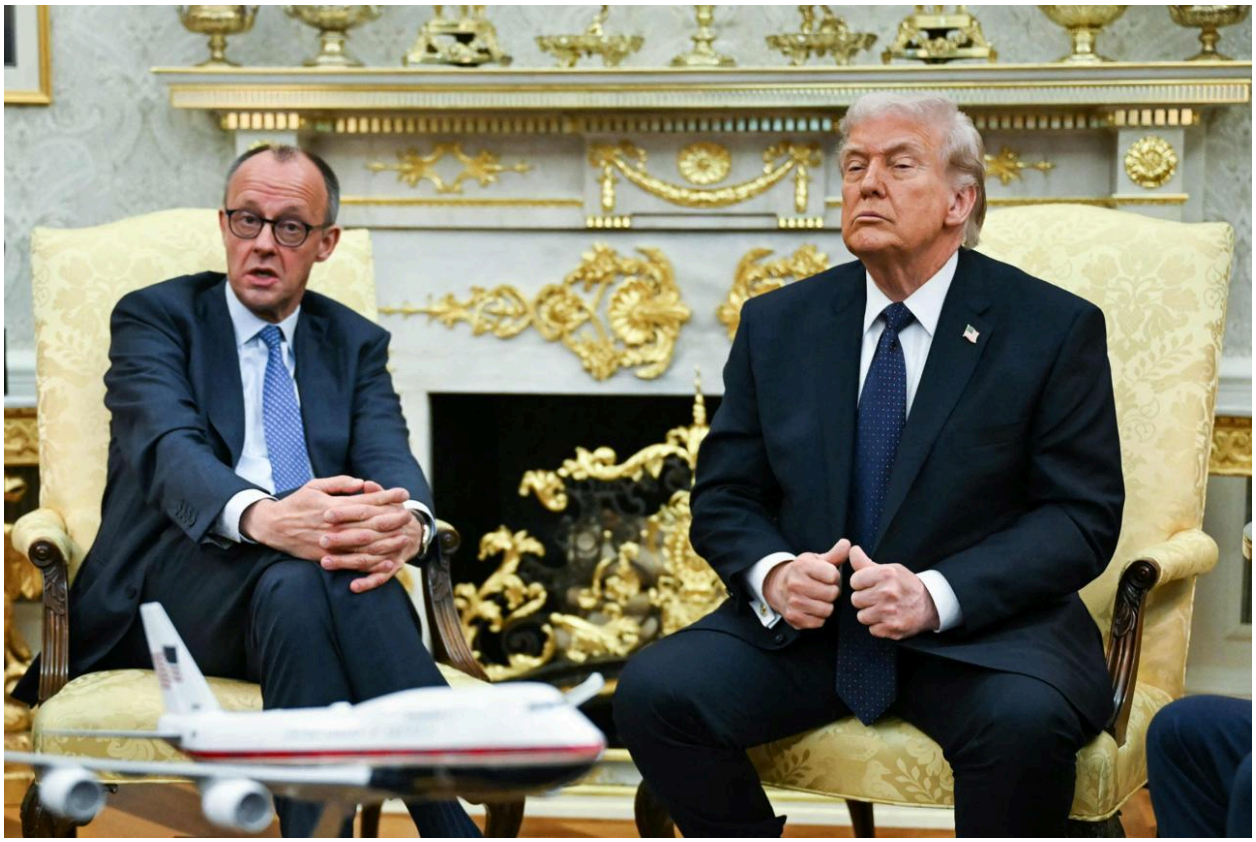

investing.com

2. Trump announces shipping solution for Hormuz

Choice 1 — Trump's actual announcement

Image · Article

Strong evidence for what Trump announced, although it is primarily textual evidence.

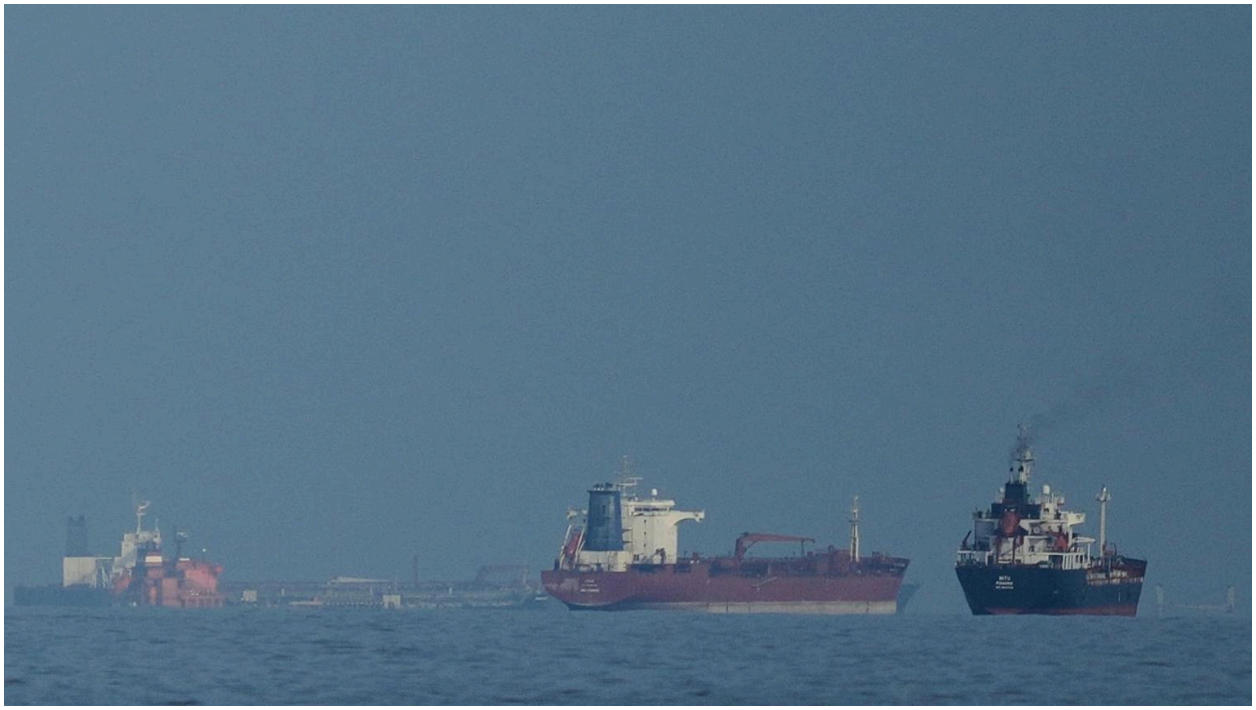

Choice 2 — Trump at White House meeting

Navy Times, March 3

A real photograph associated with the report, but INSUFFICIENT to visually prove naval escorts.

navytimes.com

Choice 3 — Naval vessel in Hormuz

Channel News Asia, March 3

Dated March 1 naval image. It shows military presence, not an implemented escort program.

⚠

CNA

3. Iranian drones attack a ship in Hormuz

For this topic, I'd prioritize images tied to an identified vessel and attack date, not generic footage of burning tankers.

1. Al Jazeera — shipping and attacks in the Gulf, March 3 — contains an IRGC naval-exercise photograph, useful as INSUFFICIENT evidence.
2. The Guardian — March 3–4 coverage with tanker photograph — real tanker photograph, but no demonstrated drone strike.
3. Original T1 Vzglyad article — inspect any article image or video against the specific reported incident.

These are search candidates, not three confirmed photographs of the drone attack. We should label them insufficient unless the actual media visibly establishes the incident.

4. Hormuz crisis strengthens Indo-Pacific–Middle East ties — RFI (Chinese)

Choice 1 — Asian energy dependence map

Image · Anadolu post

Dated March 3, 2026. A useful graphic for the economic exposure of Asian countries.

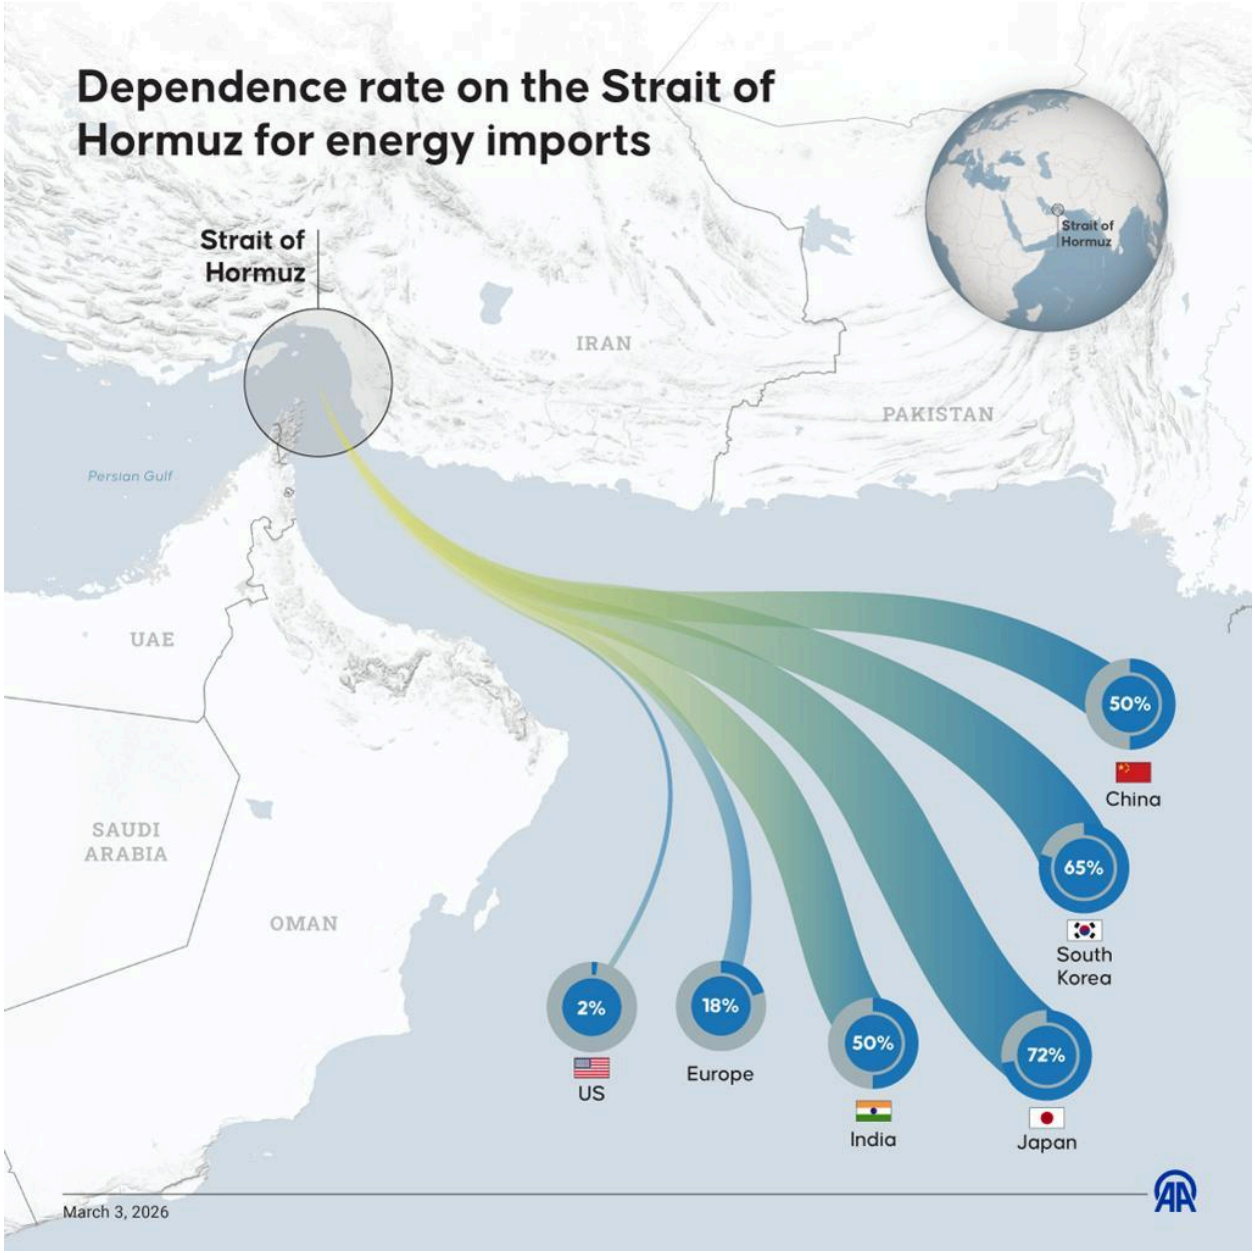

Choice 2 — Chinese shipping disruption

CSIS analysis, March 6

Maritime tracking and Chinese shipping context.

csis.org

Choice 3 — Asia's oil supply vulnerability

[Asia Business Daily, March 6]

Originally published March 6, subsequently updated. Check the displayed graphic's date.

The Asia Business Daily

5. Same regional analysis — RFI (Traditional Chinese)

This is essentially a second-language version of the previous topic, so different but related visualizations are appropriate.

Choice 1 — China's Middle Eastern oil supply map

Image · Article

Historical dependency graphic from June 2025; useful background, not evidence of March 2026 conditions.

Choice 2 — Asian import dependence

Image · Original post

Reuses a strong economic-dependency visualization, but should be deduplicated if both RFI entries appear in the same gallery.

Choice 3 — Satellite geography of the chokepoint

Axios, March 3

Uses a 2025 Copernicus-derived satellite view; geographical context rather than proof of disruption.

axios.com

6. About 1,000 vessels and $25 billion in insurance exposed

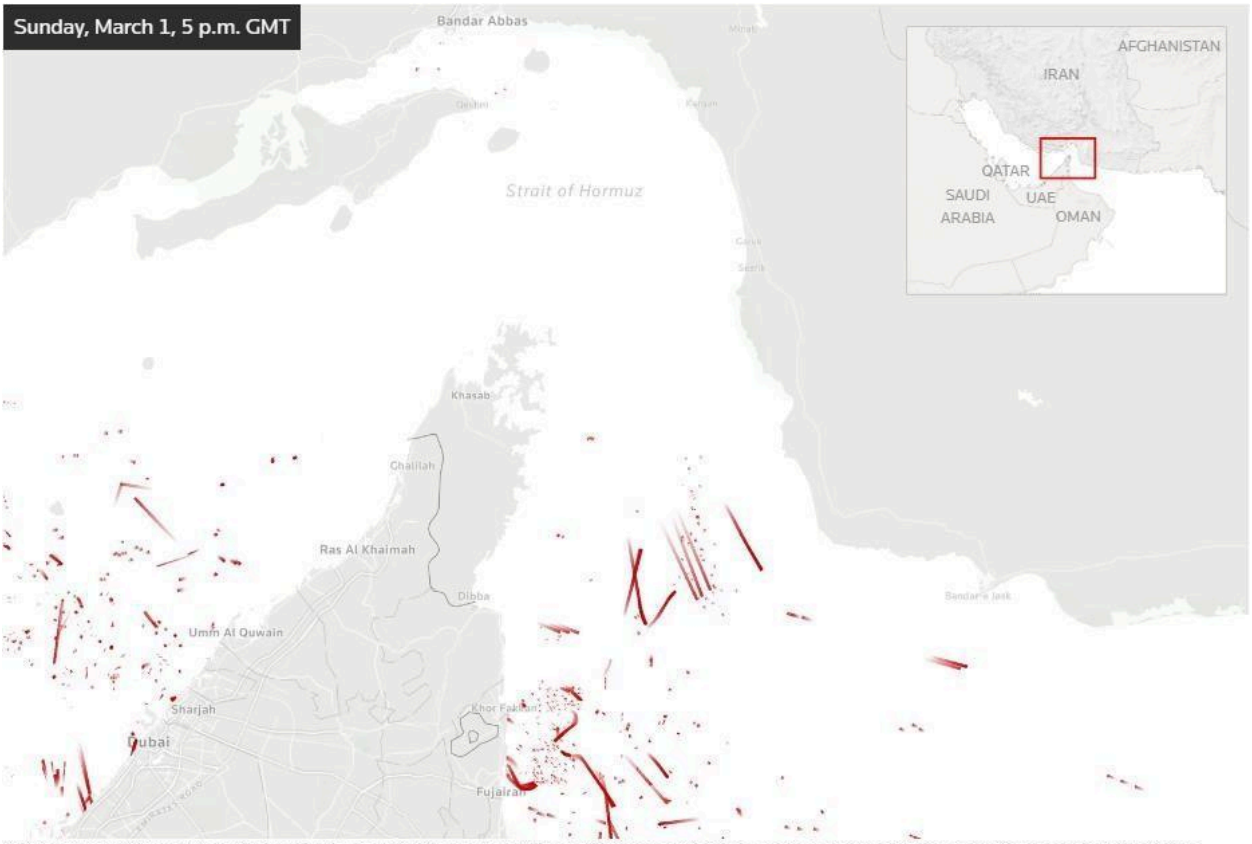

Choice 1 — Tankers waiting off Fujairah

The Guardian, March 6

Reuters photograph of vessels offshore, directly relevant to disrupted maritime activity.

The Guardian

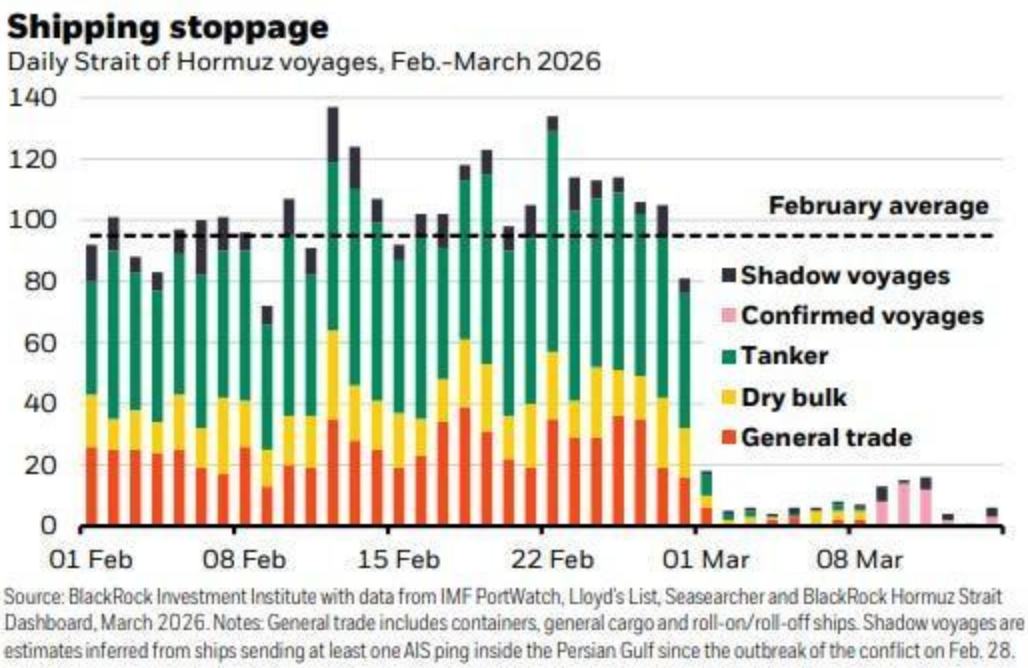

Note: Tanker traffic paths are estimated by shortest distance between recorded transponder positions, so some may be shown to cross land boundaries between positions. Positions may also include some that are "spoofed" or faked.
Source: MarineTraffic

Choice 2 — Animated shipping traffic map

[Reuters, March 5]

Stronger evidence of widespread shipping disruption than a single tanker photo.

reuters.com

Choice 3 — Ships avoiding the Strait

Insurance Journal, March 6

Contemporary shipping-security reporting with accompanying media. The precise insurance valuation requires documentary evidence.

insurancejournal.com

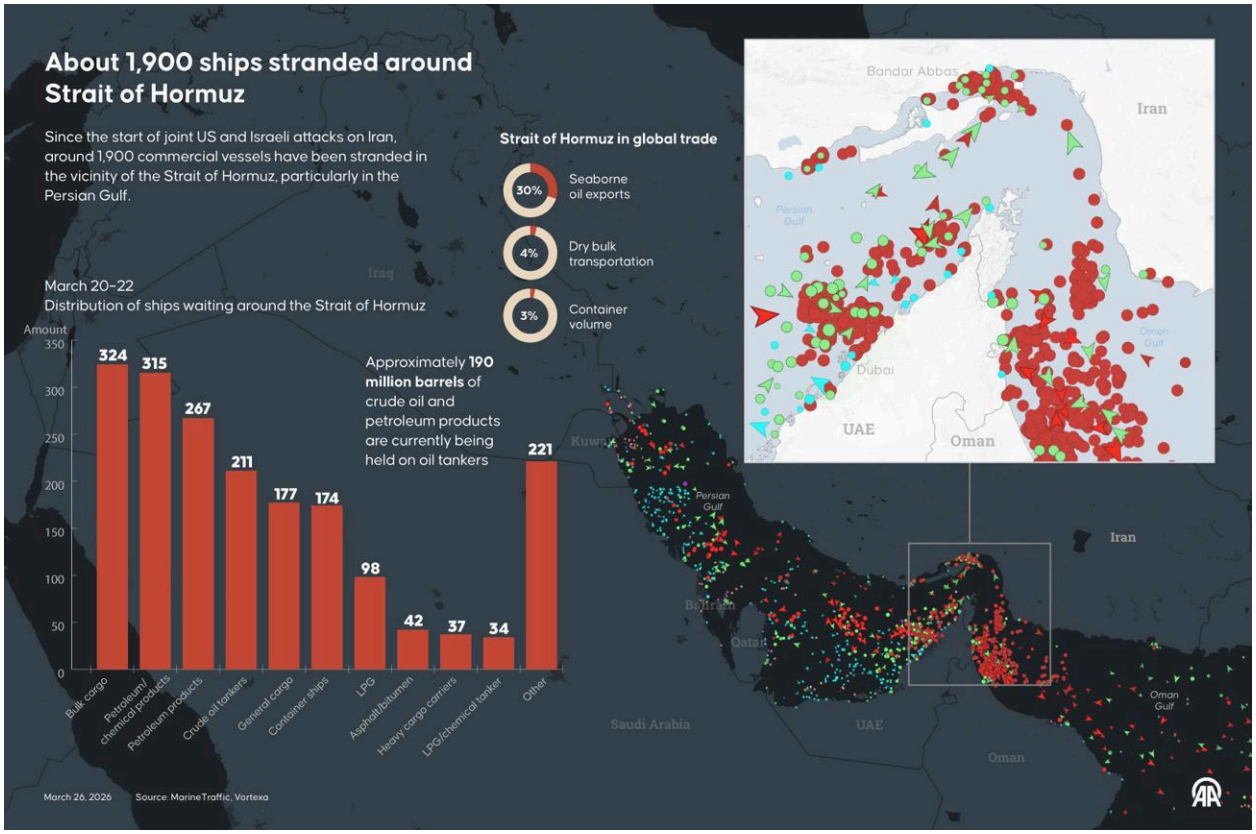

7. Who is most affected by a Hormuz blockade? — NetEase

Choice 1 — Country-by-country energy dependence

Image · Anadolu

Choice 2 — China crude-oil import flows

Image · Article

Choice 3 — Chinese vessels caught in disruption

CSIS, March 6

Good for connecting shipping disruption to China's exposure.

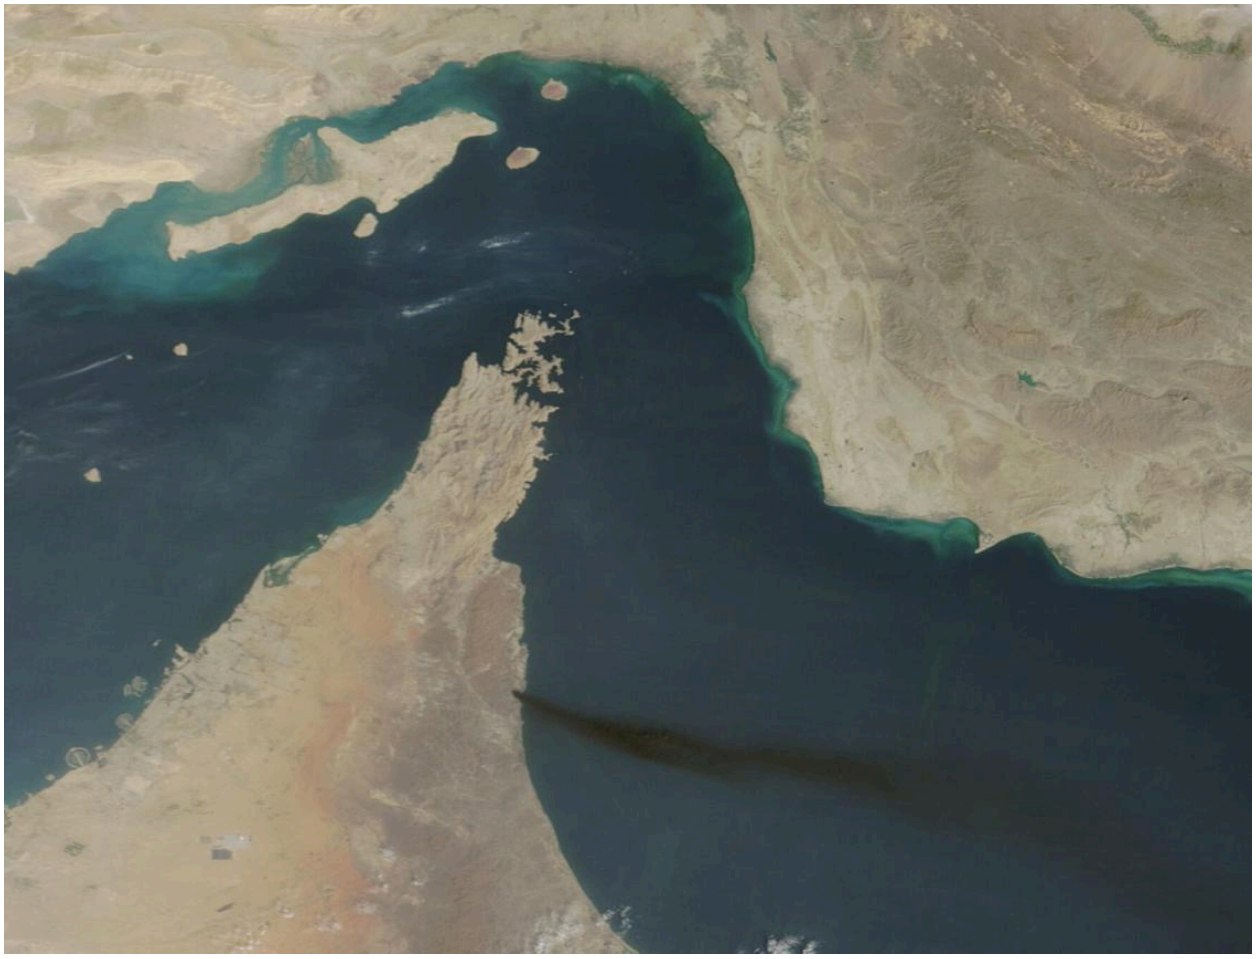

csis.org

8. U.S. plans to secure the Strait of Hormuz — PHonline

Naval vessel operating in Hormuz

[Channel News Asia, March 3]

Choice 2 — NASA photograph of the Strait

USNI News, March 3

A geographic reference image, not evidence that escorts began.

USNI News

Choice 3 — Official U.S. insurance/escort announcement

Image · Article

For Hao's actual Evidence panel, I would not include all 24. These are retrieval choices, several are reused, and some are context images rather than visual verification evidence. Select 3–5 distinct, date-appropriate media items from the set, with the Reuters March 5 shipping animation and the photographed tanker buildup among the strongest candidates.

Also, I would not label any of these `SUPPORTS` or `CONTRADICTS` until your MultiEvidence verifier has checked the actual image against an exact report claim.
